Monday, 10 September 2012 Research shows how big data is changing the face of business, from recommender systems to risk analytics and fraud detection. Big data isn't just a buzzword. It's about capturing a sea change in the way we approach technology. And that change is causing big changes in the ways business operates. As early as 1998, Alfred Sloan, founder of the Sloan Consulting Services company, predicted the rise of big data. "For us the future is going to be almost exclusively data," he said. "There will be more data being collected than the ability to manage it. We will have to make sense of data more than we have ever had to make sense of anything else." The trends Sloan foresaw have come to pass. Big data is changing the way we approach technology and business. Some of the main trends include: Deep analytics As the volume of data rises, the need for information management has never been greater. This includes creating a clean data stream to keep everything in one place. Cloud computing and open data Cloud computing is the next wave of technology. The data can be moved to the cloud, but the processing stays on-premise. This means more data can be accessed without having to buy hardware and software, and the data will be stored in a multi-tenant environment. Open data is the application of collaborative information sharing, which is transforming the way companies can interact with their data. These open data initiatives, whether driven by legislation or business, are opening up company data, making it more accessible.
