The Core Pocket Media Player is a little tool for having fun with multimedia files. It is a tiny player, but it doesn't hold back. It can play almost any multimedia format, including MP3, WAV, WMA, CDA, OGG, AVI, MPG, ASF and MOV, as well as AVI and OGG. It can also play in a loop, play songs in a loop or play a playlist. (It can also add up to 25 or more files at a time to a list.) And you can change the music files you play with the "Custom" button. You can configure many settings, but I'll just mention some of my favourites: * The "Window" option will either display song/file information or a small window with the current file playing (I find it is best to have both). * The "Playlist" button will allow you to create and add files to a playlist. You can load a playlist and add the same files over and over, or you can have a list of files that automatically plays. * The "Loop" button will play the files in a loop. * The "Stop" button will allow you to stop the playback and change the position of the file to the place where you want it. (and everything else that the "Stop" button does in other players). * The "Custom" button will let you browse and select a song to be played. (You can have up to 25 items selected at a time). You can watch a video on YouTube, listen to a bunch of MP3 files, or even play an AVI file in a slideshow. The Core Pocket Media Player is tiny and efficient, so it's great for playing media on a variety of platforms.
