We are using for best and professional text-editor software of Joomla. which can auto fix all critical issues. Please let us know is there any solution to solve these issues. A: We have a very good and advance on line website (Let's Encrypt) which is used in many of the projects that we do work on. The certificate I purchased has a validity period of 4 years, so it will expire in 2020. I recommend you renew it in 2020 (4 years from now). You are able to renew the certificate from your web browser, however, for best results, I recommend you use a web browser that supports the Let's Encrypt renewal mechanism. Note that Let's Encrypt automatically renews the certificate for as long as it is valid. If you renew the certificate with the wrong settings, you could get an invalid certificate. Note: The error is not an error for the server (at least not in this case), but is an error that is printed as part of the error response from Let's Encrypt, which is printed to your web browser. In the image below, you can see the "error" page that is returned when you visit the server, which contains the expired error. This is the error response for the request, which is made from your web browser (your IP address is not revealed), not from the server:

```
HTTP/1.1 400 Bad Request Server: Netlify Content-Length: 136 Cache-Control: public, max-age=600, s-maxage=600 Vary: Accept-Encoding Content-Type: application/json Date: Sun, 25 Dec 2019 12:33:34 GMT Allow: HEAD, GET, PUT, DELETE, OPTIONS, TRACE Via: 1.1 varnish Age: 872 ms Connection: keep-alive {"error":{"code":400,"message":"The TLS certificate for www.LetsEncrypt.org has expired."}}
```

In this case, it is a matter of error handling. Your web

browser should alert you that the certificate has expired. You can do so by: Using web browsers that support the renewal mechanism (for example, Chrome, or a browser that is built on top of Chrome) Renewing the certificate, and checking the site in your web browser. Try
